All other requests will be considered and discounted accordingly

Product Description – Training	Cost
<b>Record Administrator 2 Day Class Room Training</b> Tentative date April 23-24 at InfocentriK' s new office class room facilities for Record Administrators and IM Managers. Delivery by Peter Haar. Only 2 seats available.	\$1,500

Product Description – Additional Modules	Module Cost	Maintenance Cost
<b>Rendering</b> The Rendering module enables you to render documents in other formats (PDF, TIFF, etc.) and subsequently add the rendition to the record in a fully automated process. The VERS Rendering module is a special version of the Rendering Engine that allows the system to render documents to VEO objects, a unique long term archival storage format defined by the Victorian Electronic Records Standard (VERS). The Rendering module is utilised by customers for long term preservation of	\$10,900	\$2,300

records, as well as to render documents to supported formats before performing OCR on them.

**\$45,900**

**\$9,900**

### **OCR Image Processing with Rendering**

The OCR Image Processing module offers the ability to index TIF, JPG, PDF and other image formats to create a text rendition that contains the text of the image file using Optical Character Recognition (OCR). This means that all content that is stored in Content Manager becomes searchable, regardless of the format that it is captured in. The OCR module works in conjunction with the Rendering Module, by first extracting the text from the image and then using the Rendering Module to create a searchable rendition of the text. Content Manager can then index that text as normal as it becomes content searchable.

**\$36,900**

**\$7,900**

*Please note: Rendering module is required for OCR image processing*

### **Auto Classification**

The Auto-Classification module files suitable records under Classifications automatically. It uses the IDOL Category Function, in conjunction with records already filed in the classification system, to determine where to file content based on the key concepts included in each document. It is an aspect of Content Manager's in-built analytics designed to learn the production classification system and based on the content of documents in each classification, the module automatically classifies similar documents together. The feature is configurable so Administrators can select which classifications can be used as reference and which classifications need to be re-analysed.

**\$19,900**

**\$4,400**

### **ControlPoint**

#### **5 TB**

ControlPoint is an intricate component of Micro Focus's Information Management offering, designed to bring unmanaged content under control and address the needs for data access, consolidation, privacy, analytics, discovery, risk and value. It works both independent of Content Manager, and as a tightly integrated module of Content Manager.

The evolution of Content Manager from TRIM is a significant aspect of the solution's roadmap. TRIM may have started with Records Keeping (therefore compliance and governance) as the primary area of concern for IM professionals, but over the last 20+ years it has evolved along the

lines of not only market trends and customer needs for innovation, but as a strategic component for management of all types of content, and providing itself as a base for a comprehensive platform, managing data from unstructured repositories as well as databases. ControlPoint is a necessary component of that data management platform for all unstructured repositories, providing visibility into legacy data, facilitating transparent management, in-place management, discovery of personal and potential data privacy content, discovery of intellectual property, a 360 degree view of both the content and the metadata around data, the ability to auto categorise or classify content, build relationships of similar content across multiple repositories to enhance data value, and become a strategic system for risk, privacy and data management policies. ControlPoint not only indexes and analyses and classifies data, it also comes with an in-built policy execution engine to archive, move, capture and delete data based on the business requirements.

*Please note: 10 TB & 15 TB are also available in this promotion. Please enquire.*
